## Abstract of Project/Thesis

`````` I'm writing this on my web server terminal, using one of my favorite commands - xargs. In its stripped down form [i.e. with no arguments, but only -0 option] it allows me to write new lines without command-line interface [cli] interpreting them as executable commands.  
But when I hit Enter it goes to a new line, after which I can't go back and edit it in this environment/session -- no backspaces in here.  
Ctrl+d exits the command and logs the input into the text file:  
I'm funneling this session into 00.txt.

||||||||||||||||||||||||||||||||||||||||||||||||||||||||

\$ xargs -0 >> 00.txt

```
was curious abt Disroot
and how those tools are hosted
```

he so disroot is a project coming from people that were involved with LAG and later decided to focus on that project and also the rest of their life, so that did not live so much time to involve in a collective that takes also a lot of time and energies.. so since they wanted to offer services, in a sense, that needed an approach for sure more in line with contemporary computing, like virtual machines, dockers stuff like this I have really hardly any clue about.. but I can give you some contacts if you want to research further into that ^^

i'd love that, thank you!

and that's an example of the different needs/capacities of projects.. to give that type of stable services that you wish to be used by people into movements/political projects around, I imagine that would be difficult within LAG infrastructure for example.. that is more prone to experimentation and sudden issues :D

```
that resonates painfully; i crashed my server a few times and lost my pads, so the idea of loosin
g someone else's pads....ouch
```

so yes, it requires very focusehahda yes.. haave seen a few cases of presense

```
//were you involved in LOREA?
```

hey I lost the connection sry

LOREA not directly but knew people in amsterdam that were.. and quite interesting project I have to say. especially as a reminder of the relation between technical and social experimentation.. as a project coming from the squares occupations in catalunya and spain, where it was really devel

~~~~~RPi setup documentation

Connect your RPi to a router with an ethernet cable. To try to ssh into it using the default credentials

ssh pi@raspberrypi

If it didn't work, find the RPi IP address first. For this reason, scan your local network

nmap -sn 192.168.1.1/255

I'm gonna use my RPi IP address [ 192.168.1.4 ], and default username [ pi ] and password [ raspberry ] to ssh into it

ssh pi@192.168.1.4

In case you get the following message: Wi-Fi is currently blocked by rfkill

sudo rfkill unblock 0
